

1. Home screen of the Random Password Generator website.

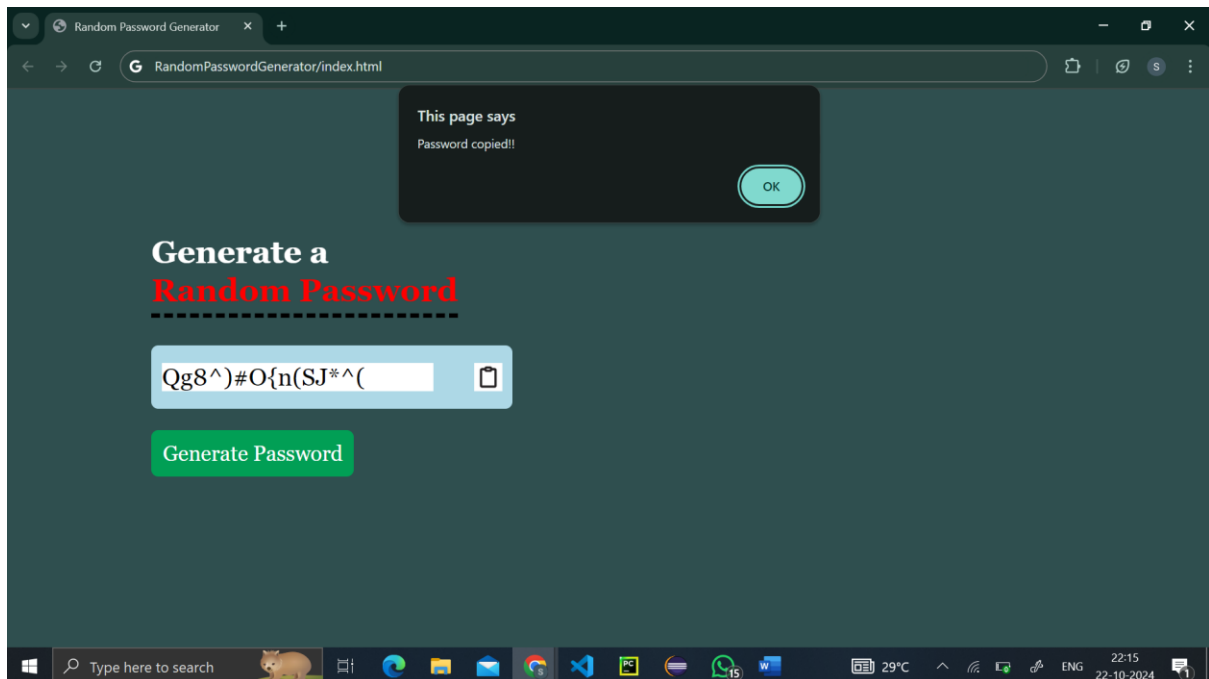

2. Displaying an error when you click on copy button without clicking the "Generate Password" button.

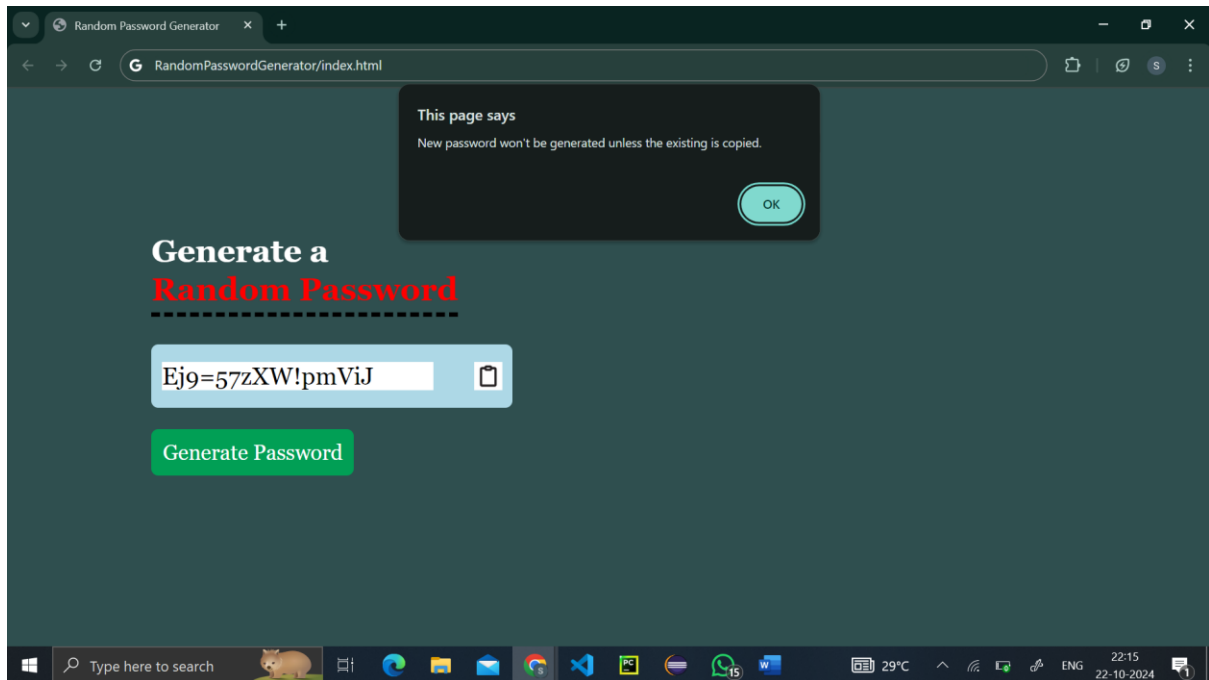

3. Password being generated when you click on the “Generate Password” button.

4. By the clicking on the notepad icon to copy the generated password, we get an alert saying the password is copied.

5. We are not supposed to generate a new password until the old one is copied.

6. By giving users the read only access from HTML file and adding an EventListener in JavaScript, we can prevent them from editing/deleting any characters in the password input box. We only give them the access to copy the generated password to their clipboard.
7. Also, after copying the password the input box becomes empty and the old password disappears to avoid any further confusions.
